PVC Windows

Windows are one of the most important elements in our home.

Properly selected, they give the desired character and become a showcase of the building.

Our windows combine a unique design, advanced technologies in the energy-saving and innovative functional solutions, providing comfort and safety.

Stollar Energo 82

RC1N, RC2N,
RC1, RC2

$U_g = 0,5 \text{ W/m}^2\text{K}$

$R_w = < 50 \text{ dB}$

$U_w \Rightarrow 0,77 \text{ W/m}^2\text{K}$

The **ENERGO system** is a product unique in its class with a profile depth of 82.5 mm. Its 6-chamber structure allows for very good thermal insulation properties ($U_w = 0.77/\text{m}^2\text{K}$ for the reference window), which translates into a reduction in heating costs. It includes a central gasket and a thrust gasket in the form of three gaskets.

6 chambers in the frame

82 mm installation depth

The possibility of using the STV method – paste the glass in the wing, to design larger constructions

Energio system with a triple glazing

Energio system – door with an aluminum threshold

The STV® technology (dry static glazing) consists in gluing the glass and the leaf profile with double-sided adhesive tape while maintaining traditional blocking.

As a result of gluing the glass with the leaf profile, the statics of the glass pane is transferred to the leaf and thus the entire system becomes more stable.

Stollar Comfort 74

RC1N, RC2N,
RC1, RC2

$U_g = 1,1 \text{ W/m}^2\text{K}$
 $U_g = 0,6 \text{ W/m}^2\text{K}$

$R_w = < 50 \text{ dB}$

$U_w \Rightarrow 0,86$
 $\text{W/m}^2\text{K}$

When designing the **Stollar Comfort 74 system**, a lot of attention was paid to the issue of statics. A carefully planned, spacious main chamber is adapted to the assembly of large steel reinforcements.

6 chambers in the frame

74 mm installation depth

2 seals around the circumference

Comfort system with a double glazing

Comfort system with a triple glazing

Comfort system – doors with an aluminum threshold

- ✓ Thermal insulation due to six chambers in the frame and sash
- ✓ Easy maintenance thanks to the large and smooth rebate surface
- ✓ The possibility of using the STV method – paste the glass in the wing, to design larger constructions

System Comfort with double glazing (renovation profile)

35 mm

40 mm

65 mm

Renovation profiles are an ideal solution used to install windows without the need to disassemble the old frames.

Such a solution perfectly reduces the risk of damage to the building facade, while speeding up the time to replace windows. The renovation frames are additionally lowered so that the glazing area is not significantly reduced.

It is available in the double and triple glazing of the Comfort System.

Stollar Slim Line 70

$$U_g = 1,1 \text{ W/m}^2\text{K}$$

$$U_g = 0,6 \text{ W/m}^2\text{K}$$

$$R_w \leq 50 \text{ dB}$$

$$U_w \Rightarrow 0,9$$

$$\text{W/m}^2\text{K}$$

The **SLIM LINE** is a product designed based on proven design solutions. Large glazing is not a problem. Windows with an extraordinary white coating are the best option in their price category.

6 chambers in the frame

70 mm installation depth

2 seals around the circumference

Slim Line system with a double glazing

Slim Line system with a triple glazing

Profile has a 6-chambers,
and its depth is 70 mm.
This system meets all the standards for
tightness and thermal insulation.

Full of choices, from any colour to any type!

Our eyes can see different type of colours.

It is natural that we want to find those
colours in our daily routine.

For this reason, we are constantly
enriching our offer with newer
and newer colors.

All this to give natural and saturated
colors, that makes our windows more
stylish and liveliness.

Collection of handles

Handles in the SecuForte® system

Hamburg SecuForte®

Available colours:

Toulon SecuForte®

Available colours:

SecuForte® is one of the safest handles on the market, because the handle and spindle are not connected with each other as in classic solutions, which gives additional anti-burglary properties.

To open the window, push the handle towards the rosette **(1)**, then rotate **(2)**.

Handles in the Secustik® system

Toulon Secustik®

Available colours:

Atlanta Secustik®

Available colours:

Secustik® turning the handle through 180° from the closed position to tilt causes audible snap into the locking mechanism selfprotected precision clique in different positions.

This typical Secustik® sound adds an audible touch of safety.

Turning the handle causes audible snap with precision clique, mounted on the spring bolts securing **(1)** in special grooves in the case **(2)**.

Handles locked by the key

Hamburg SecuForte®

Available colours:

Window handle **Hamburg SecuForte®** adjusts the length of the pin to a depth of window profile. This is possible because the compression spring is placed in the middle of the handle at the pin. Because of that spring mechanism the pin stays static pushed, this ensuring proper fit.

The window handle covers depth differences up to 10mm and so it can be used for windows with different profile cross-sections.

Toulon SecuForte®

Available colours:

In the case of the **Toulon SecuForte®** handle with a double function, turning is only possible when the button locking cylinder is unlocked and pressed.

This means that the handle can be turned only after opening the lock cylinder by pressing a button. If the cylinder is not pressed, the handle will be locked in the closed position 0° and tilted 180°.

Collection of handles

Tokyo

Freestyle

Special handles play a special role in sliding systems and in outward opening windows, where they enable optimal, comfortable operation.

Accessories and additions

Ventilation

Ventilators installed in the sash of the window, are part of the ventilation system and ensure proper supply of fresh air into our apartment.

Everyday household activities result in the precipitation of water vapor which leads to an increase in internal moisture ratio. Excessive humidity has a very negative impact on our health and on the building itself.

The solution that allows to obtain the original appearance of windows is the use of ornamental panes. Due to many functional and decorative values, ornaments have a very wide range of applications.

They are successfully used as glazing elements for partition walls in places such as bathrooms or kitchens. A wide range of patterns allows them to be used in housing and industrial purposes.

* the possibility of mounting ornaments in a vertical and horizontal position

Internal muntins and external stuck-on muntins

Internal muntins

It is a classic proposal with an extraordinary presence. The muntins are mounted in between glazing spacer which is part of the glazing unit. Thanks to this solution, dust or moisture will not have access. Which means that they do not need to be washed or maintained.

External stuck-on muntins

In this case, the muntins are glued directly to the glass. They are made of the same material as the window, creating a visually integral product.

Fittings

SIEGENIA fittings make it easier to open the sash and provide greater security.

Optionally, the windows can be equipped with hidden hinges **SIEGENIA AXXENT 24** with self-adjusting rollers KoPiBo reducing friction during closing the window.

Safety

Standard window joinery does not provide the optimal level of protection against burglary.

The fittings and glass used in the windows do not provide adequate security when attempted to break through by burglars. As a result, the risk of robbing a property is higher.

Today, we can also find safe windows with increased burglary resistance. To define this level of safety, resistance classes must be marked as **RC**.

RC class replaced the previously existing class WK. In the case of joinery used in single-family housing, we usually deal with two classes **RC1** and **RC2**.

* Number of locking hook-points depending on the size of the window

Fitting burglar resistance class

RC1 and **RC2** will provide proper protection against burglary.

This makes it difficult to get inside through the appropriate number of anti-theft catches and the use of a handle with a key and a special laminated glass.

Warm edge spacer

The **TGI-Spacer** is a combination of great parameters and aesthetics.

They are made of plastic combined with a thin sheet of stainless steel.

The used material has a very low thermal conductivity, thus decreasing the U_w value in whole construction.

V-Perfect welding

Innovative and stylish technology of connecting profiles that using all of it potential.

Thanks to this, the weldings are on a completely different level.

It introduces our PVC windows to the path of new architectural possibilities.

Cassonetto

Available colours:

The **Cassonetto** system is a modern box made of special PVC profiles.

Perfectly replaces older wooden or aluminum models.

Modern solutions are characterized by durability, functionality and aesthetics.

STOLLAR Window Systems

The home has an important place in the human heart.

Everyone spends most of their free time there, relaxing in the comfort of a properly lighted and pleasant interior.

That is why we make every effort to ensure that our products satisfy the most demanding tastes and care for the convenience of use of all our customers.

Our windows guarantee high comfort and will transform any interior into a house full of splendor, warmth and elegance.

Many years of experience in PVC joinery allowed us to complete a team that professionally deals with the production, assembly and sale of our products.

Every person on our team cares about the comfort of both colleagues and customers.
